

WORLD CLASS CLIENT RELATIONS WITH UNSURPASSED RECYCLING TECHNOLOGY

ABOUT CONECSUS

Conecsus began operating as an independent company in February, 2012. This was done as part of a broader transaction in which individual businesses within ECS Refining were placed into separate companies, in order to allow various business units to be recognized individually and associated with their individual markets. The company's ownership, operation, and commitment to excellence has not changed.

With 18 years in business, our Terrell, TX smelter is the cleanest, most modern and advanced recycling facility of its type in the United States, housing the largest rotary furnace for tin/lead residues in North America, and has continually developed novel recycling technologies and processes in order to offer a greater breadth of capabilities to our clients. We remain a leader in recycling through these improvements, enabling generators to send in more varied materials than ever before.

A LEADER IN RECYCLING

Unlike our competitors that serve the electronics assembly market, Conecsus' sole business is the refining of byproducts, residues, and waste streams to produce mixed metal. As such, one hundred percent of our research and development goes into recycling technologies that make us better, cleaner, smarter, and faster, as well as allowing us to expand the breadth of our capabilities to solve more of our clients' problems.

OUR PROGRAMS

The fact that we do not sell raw materials back into the electronics assembly market allows us to be the most fair and transparent recycler in the market; our interests are making you a happy recycling customer, not providing you high-margin raw materials. At the beginning of every transaction, we give you an accurate estimate with all fees and conditions given in plain English, as well as a purchase order and all applicable shipping documents. On the back end we provide you a simple, easy to read settlement report that indicates the price paid per pound for each individual lot shipped, as well as the physical concentrations of payable metals to the 0.0001% precision. Each lot of material received is weighed on our certified scales, and assayed individually in our cutting edge laboratory, guaranteeing that you receive payment based on the actual weight shipped to us and the metal chemistries found therein.
